

# Tutorial instalação Terraform

## Baixar executável

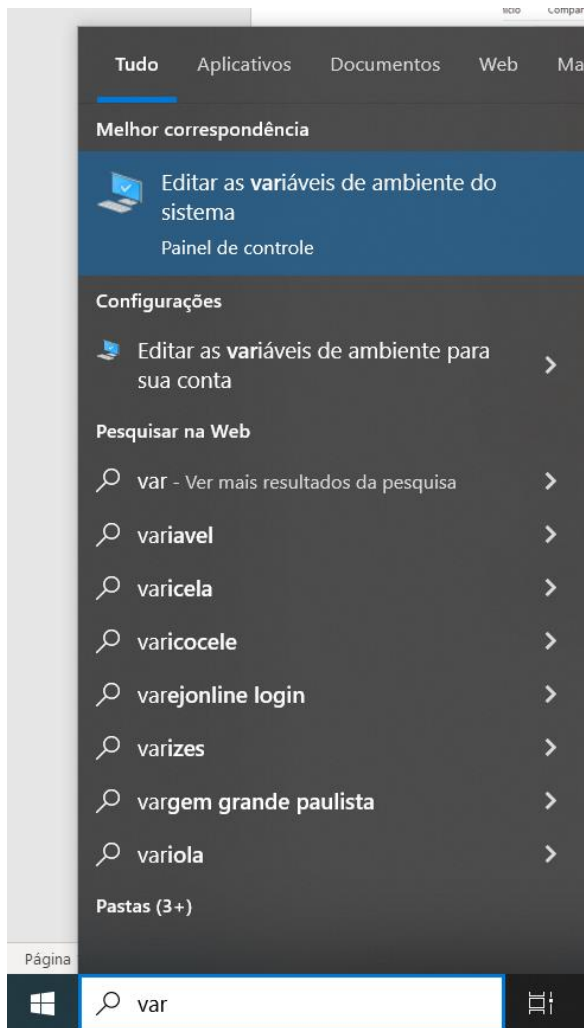

<https://developer.hashicorp.com/terraform/install#windows>

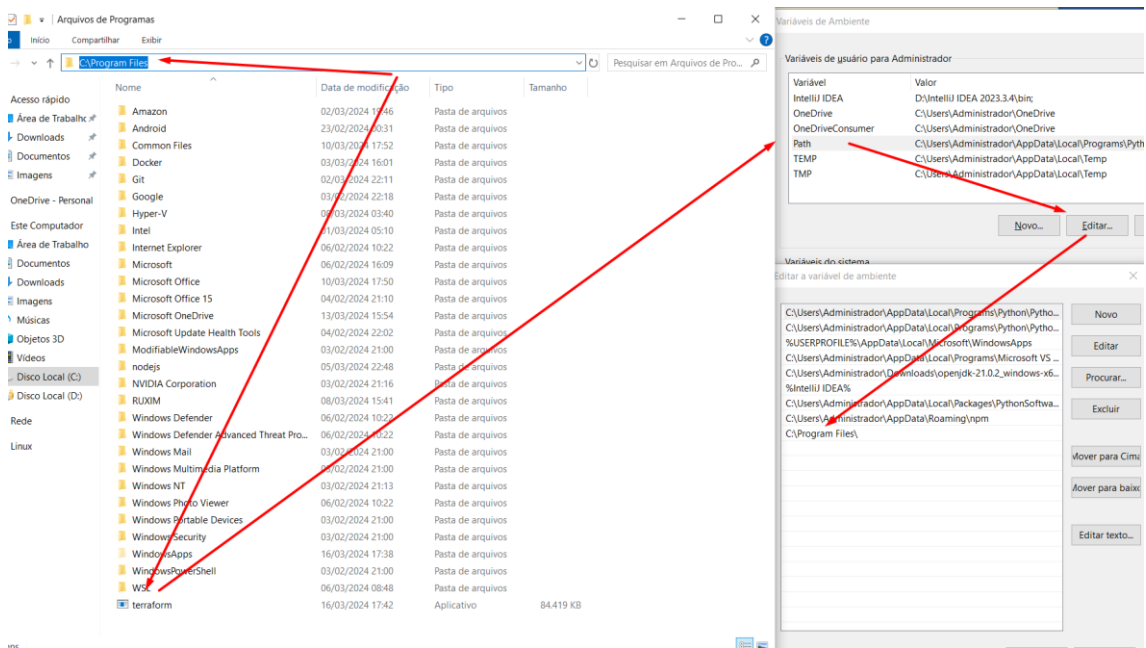

## Colar executável na pasta c: Programs Files

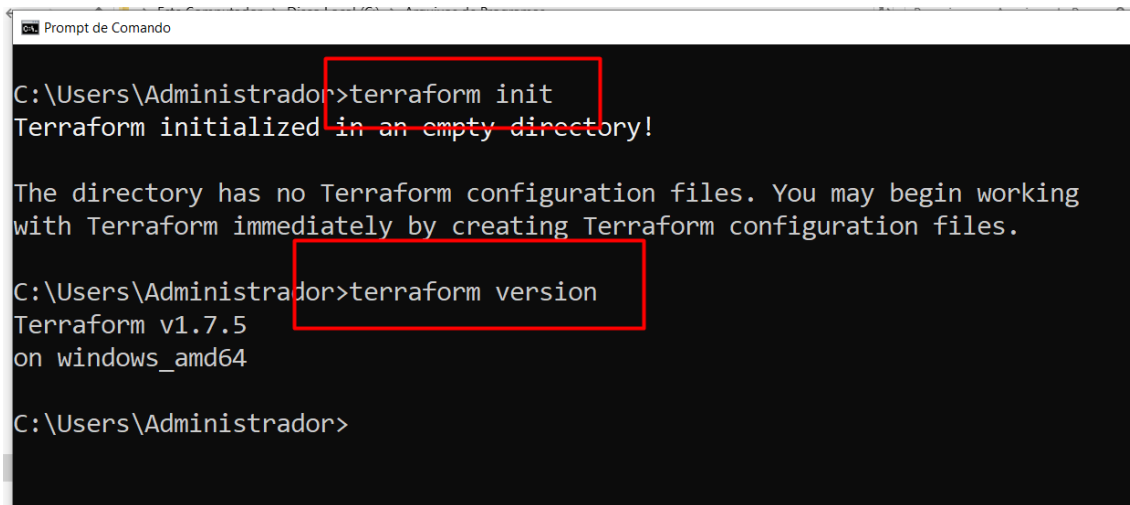

## Abrir variáveis de ambiente no Windows

Pode-se escolher um terraform\_home, mas aqui fiz de maneira simples

Abrir um novo terminal e testar se funciona

```
Prompt de Comando

C:\Users\Administrador>terraform init
Terraform initialized in an empty directory!

The directory has no Terraform configuration files. You may begin working
with Terraform immediately by creating Terraform configuration files.

C:\Users\Administrador>terraform version
Terraform v1.7.5
on windows_amd64

C:\Users\Administrador>
```

The image shows a Windows Command Prompt window with a black background and white text. The title bar at the top reads 'Prompt de Comando'. The command prompt shows the user 'Administrador' at the 'C:\Users\Administrador' directory. The first command executed is 'terraform init', which outputs 'Terraform initialized in an empty directory!' followed by a message stating that the directory has no Terraform configuration files and that the user can begin working by creating them. The second command is 'terraform version', which outputs 'Terraform v1.7.5 on windows\_amd64'. The prompt ends with 'C:\Users\Administrador>'. Two red rectangular boxes are drawn on the image: one around the 'terraform init' command and its output, and another around the 'terraform version' command and its output.
